Additions to Notes on *Theaetetus*:

Three propositions at 155 that as a group are allegedly contradictory:

1. What becomes more or less in size or number, does not remain equal to itself.
2. That from which nothing is added or subtracted, remains equal to itself.
3. That which afterwards is what it was not previously, becomes.
4. (what conclusions follow from these propositions by themselves? The middle term is “that which becomes”—so.)
5. That which afterwards is what it previously was not (in quantity), has had something added or subtracted to or from it.
6. (But this is not true for relative changes that occur through becoming in another.)
