

Applied Conjoint Analysis

Applied Conjoint Analysis

Conjoint, or trade-off, analysis can be a powerful tool for the marketer, typically used when the research question concerns product or service development issues or pricing strategies.

By asking respondents to “trade-off” one product feature to obtain another, conjoint unearths the importance of product features to consumers’ purchase decisions, and calculates the particular combination of price and specific product features which maximize a product’s appeal to consumers.

A Note on the Effectiveness of Conjoint Analysis

*“Traditional conjoint analysis makes some heroic assumptions, including the proposition that the value of a product is equal to the sum of the value of its parts (i.e., simple additivity), and that complex decision-making can be explained using a limited number of dimensions. Despite the leaps of faith, **conjoint analysis tends to work well in practice, and gives managers, engineers and marketers great insight to reduce uncertainty when facing important decisions.** Conjoint analysis isn’t perfect, but we don’t need it to be. With all its assumptions and imperfections, **it still trumps other methods.**”*

Conjoint Overview

Factors or Features

Levels within Factors

Key Outputs:

- Relative importance of factors
- Preference for levels of a given factor
- Utility structures

Key Analysis:

- Simulation models
 - current product mix
 - new product development
 - segmentation
- Price elasticity

Product Factors

Kitchen Faucets:

- Type of handles
- Type of spout
- Finish
- Sprayer
- Washer type
- Warranty
- Brand
- Price

Levels of Product Factors

Kitchen Faucets:

-Type of handles

- **2 handled metal**
- **2 handled acrylic**
- **1 handled ball**

Etc.

**2 HANDLE
METAL LEVERS**

**1 HANDLE
BALL LEVER**

**2 HANDLE
ACRYLIC KNOBS**

How do I know what factors and levels to use?

- Typically, qualitative analysis is done first (focus groups, for instance)***
- Look to your client (as a vendor)***
- If YOU ARE the client, look to internal decision makers, product managers, secondary data – do your homework!***

***Without the right factors and levels,
a conjoint study is worthless!***

The Process

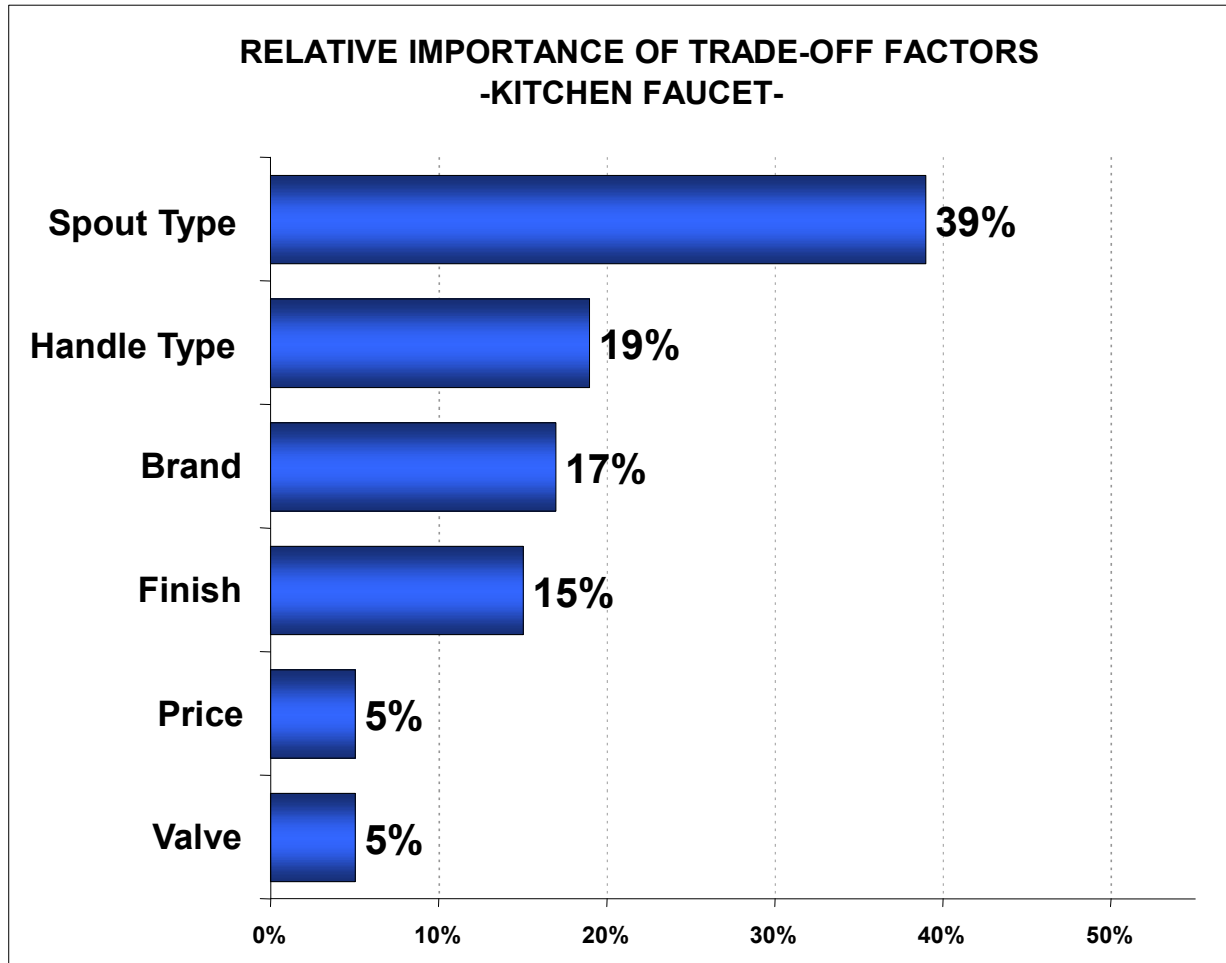

Once you've selected factors and levels, be sure to provide the appropriate stimuli to respondents prior to the conjoint task.

For example, if finish is a factor, show REAL versions, not just images or descriptions.

Key Outputs

FACTOR IMPORTANCE

The importance of each “product factor” to the consumer’s product selection. For example, how much impact does finish type have compared to price or brand?

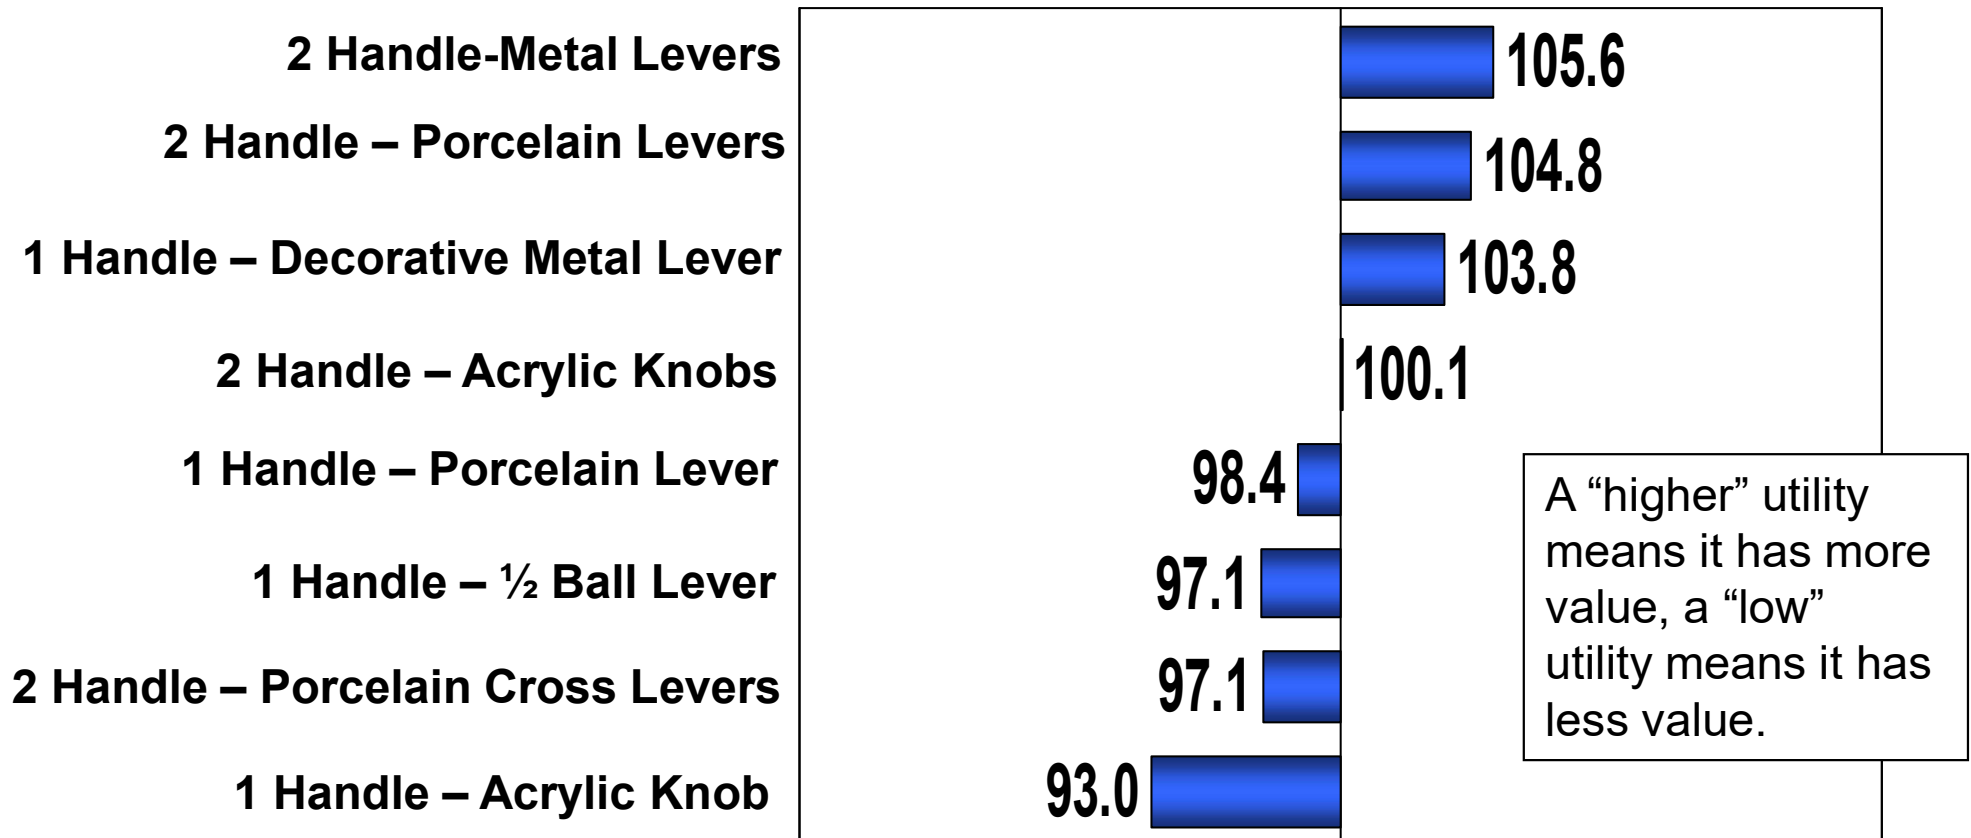

The following is an example from the kitchen faucet discussed earlier.

As can be seen, the type of spout has much more impact than either handle type or brand.

UTILITY STRUCTURE

“Utility” is a numerical expression of the value consumers place on an factor level.

UTILITY: HANDLE TYPE

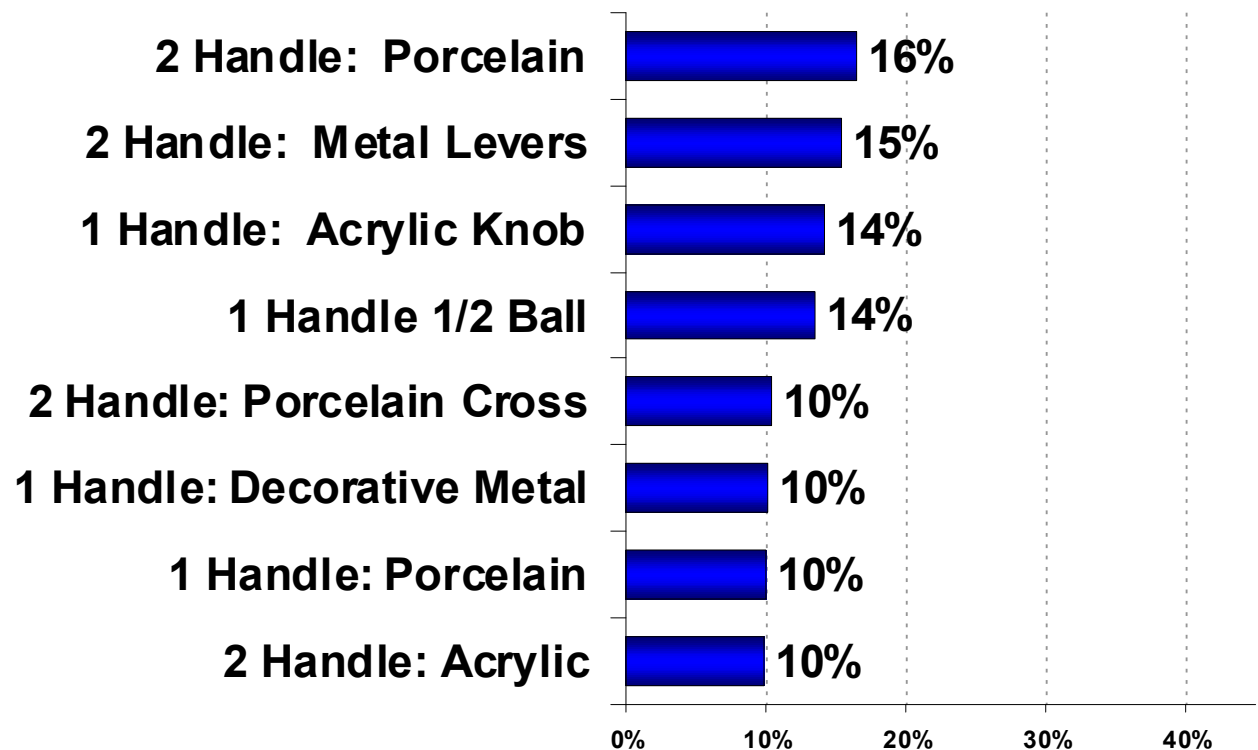

LEVEL PREFERENCE

The value of each “level” of a factor to consumers (e.g., the different finishes tested).

The sample graphic shows the percent preferring each level of the ‘handle’ factor for the kitchen faucet example.

LEVEL PREFERENCE: *HANDLE TYPE*

UTILITY STRUCTURE

Composition Rule: Additive

Factor1, Level1+Factor2,Level3+Factor3,Level2=Overall Utility

SIMULATION

Kitchen Faucet Simulation: Single Handles

CONJOINT METHODS

Three main categories

- Traditional
- ACA (Adaptive Conjoint)
- CBC (Choice Based Conjoint)

Traditional Conjoint

Uses an “orthogonal array” for product combinations.

The trade-off task is typically a card sort – for example, 16 cards depicting the array were given to respondents and sorted from most desirable to least desirable. Ratings can be used as well.

The analysis takes the rank order (or ratings) of the stimuli and uses it to calculate individual utilities that can then be extrapolated to all possible combinations.

- Price elasticity is suspect.
- Limited number of factors and levels.
- Main effects model.

TRADITIONAL CONJOINT EXAMPLE

- Stimuli needed**
- Respondent task**
- Data analysis**

SUBJECT NAME: 310

Importance	Utility(s.e.)	Factor	
		BRAND	BRAND
56.41	-1.0000 (1.3434)	-	BALDWIN

ACA

Adaptive Conjoint Analysis is a hybrid conjoint approach in that it uses both analysis of product combinations (combinations of factor levels) as well as self-reported importance information to derive utilities.

Three components of analysis:

- Factor ratings (preferability)
- Rank order of levels within factors
- Graded comparisons of partial product combinations

- It allows for a larger number of factors and levels can be analyzed.
- Can only be administered via computer.
- Cannot analyze interactions.
- Price elasticity still an issue.

EXAMPLE: factor ratings (preferability)

MS Acq

Auto

Indicate the desirability for each item.
Select a number from the scale for EACH feature.

4	Single-Swing Door	#3A
3	Double-Swing Door	#3B
2	Sliding Door	#3C
	Roll Up Door	#3D
	Bi-Fold Door	#3E

Not At All Desirable Somewhat Desirable Extremely Desirable

1 — 2 — 3 — 4 — 5 — 6 — 7 — 8 — 9

Type number ESC to back up CTRL END to quit

EXAMPLE: comparisons of factor levels

MS Acq

Auto

If two outdoor sheds were both acceptable in all other ways, how much MORE important is the TOP attribute compared with the BOTTOM attribute?

To answer, type a number from the scale below.

Single-Swing Door #3A

versus

Bi-Fold Door #3E_

Not Important At All 1 ————— 2 Somewhat Important ————— 3 Very Important ————— 4 Extremely Important

Type number | ESC to back up | CTRL END to quit

EXAMPLE: product comparisons

MS Acq

Auto

For example, two descriptions are shown below. Decide which one you would prefer, and your strength of preference.

If you strongly prefer the one on the left, type a number from the far left side of the scale. If you strongly prefer the one on the right, type a number from the far right side of the scale. Choose middle numbers if your preference is not strong.

Beautifully Designed but High Cost	OR	Inconvenient Designed but Low Cost
--	----	--

Strongly Prefer Left Don't Care Strongly Prefer Right

1 — 2 — 3 — 4 — 5 — 6 — 7 — 8 — 9

Press any key to continue | ESC to back up | CTRL END to quit

EXAMPLE: purchase likelihood

MS Acq

Auto

HOW LIKELY (from 0% to 100%) WOULD YOU BE TO BUY THIS OUTDOOR SHED?
Answer by typing a number from 0% to 100%.

Very Likely	Flat Roofstyle	#2A
100%	Rounded Shingle Roof	#4E
90%	Gray with Green Color	#8E
80%	Multi-Color Stone Trim Accent	#7B
70%	Bi-Fold Door	#3E
60%	Cedar Sided Side Finish	#6D
50%	\$499 Suggested Retail Price	#9B
40%	Raised Door Panel Finish	#5E
30%		
20%		
10%		
0%		
Not At All Likely		

Type a number from 0 to 100, then press ENTER.
Previous Answers:

Type number (0-100) | ESC to back up | CTRL END to quit

CBC

CBC, or Choice Based Conjoint, has become the preferred method, due to its ability to truly gauge price elasticity, and its easy to comprehend trade-off task.

Full product combinations are pitted against each other in “choice sets”. Respondents choose among the products depicted, or (as an option) can choose none of the products.

A respondent typically receives anywhere from 10 to 20 choice sets, depending on the number of factors and levels in the design.

- Its modeling capabilities (interactions, special effects, etc.) are seen as an improvement from prior methods.
- Due to relative pricing, elasticity models are more accurate.
- Like ACA, allows for more factors and levels than traditional method.
- Individual utilities now available (first versions generated aggregate models)

CBC EXAMPLE

- Stimuli needed
- Respondent task
- Data analysis

In this section, we'll be asking you some additional questions about file storage products.

We'd like you to imagine that you are considering purchasing a file storage product for your use in the setting we have been discussing.

We'll show you some different combinations of the features that make up your decision to choose one file storage product over others, and we will ask which one you would prefer. The combinations we'll be showing include those features you just reviewed and identified your top choices.

Some of the file storage product choices you are going to see are not currently available on the market, but we would like you to **imagine that they were available today**.

It is important that you answer in the way you would be thinking if you were actually thinking about purchasing one of the file storage products.

Next

If these were your only options, which would you choose?

Choose by clicking one of the buttons below:

HANDLES

Handle located on sides of unit, metal handle with soft grip

Handle located on back of unit, with ability to expand

Handle located on sides of unit, with shoulder strap for carrying

LATCHES

Two latches on either side of lid, can act as a hinge

Single latch at center of lid, metal latch

Two latches on lid (side by side), large soft grip

LIDS

Removable lid

Prop hinge/ arm lid

Push and release lid

HINGE TYPE

Interlocking plastic hinge

Removable storage compartments located in lid

STORAGE OPTIONS

Miscellaneous storage compartments located under lid inside unit

Adjustable storage compartments located under lid

The storage unit has four rollers

MOBILITY OPTIONS

The storage unit has no wheels or rollers

The storage unit has a keyed lock

The storage unit has an integrated lock hole

LOCKING OPTIONS

The storage unit has no locking mechanism

The storage unit has a keyed lock

The storage unit has an integrated lock hole

PAPER SIZE

Both Letter and Legal sized storage

Legal sized storage

Letter sized storage

FILE PLACEMENT

Cascading files

Standard standing files

Cascading files

PRICE

Max/Diff Analysis

Max/Diff Analysis

MaxDiff is an approach for obtaining preference/importance scores for multiple items (brand preferences, brand images, product features, advertising claims, etc.). Although MaxDiff shares much in common with conjoint analysis, it is easier to use and applicable to a wider variety of research situations. MaxDiff is also known as “best-worst scaling.” *

MaxDiff (or Best/Worst) is primarily used to gain a hierarchy of a set of items – such as importance ratings, value propositions, menu choices, etc.

Like ‘conjoint’ or ‘discrete choice’ methods, the result is a ‘derived’ measure of strength or impact.

*Why use MaxDiff instead of standard rating scales? Research has shown that MaxDiff scores demonstrate greater discrimination among items and between respondents on the items. The MaxDiff question is simple to understand, so respondents from children to adults with a variety of educational and cultural backgrounds can provide reliable data. Since respondents make choices rather than expressing strength of preference using some numeric scale, there is no opportunity for scale use bias. This is an extremely valuable property for cross-cultural research studies. **

*Source: Sawtooth Software

MaxDiff / Web Tutorial Example

Imagine you were making the decision to reenlist in the Navy today. Which of the following four factors would make you most and least likely to want to reenlist?

Makes me <u>Most</u> want to reenlist		Makes me <u>Least</u> want to reenlist
<input type="radio"/>	Receive phone-based personal counseling services	<input type="radio"/>
<input type="radio"/>	Location guarantee for next assignment	<input type="radio"/>
<input type="radio"/>	Current reenlistment bonus (\$2,500)	<input type="radio"/>
<input type="radio"/>	Choice between living in 2-person barracks or 4-person barracks when in port	<input type="radio"/>
